

Posterior Migration of a Malyugin Ring During Phacoemulsification and Subsequent Retrieval Through the Pars Plana

Friday, April 17, 2015  
KIOSKS (San Diego Convention Center)

**Michael Erlanger, MD**  
Jeffrey L. Olson, MD

Video shows an uncommon complication during cataract surgery; that is, the posterior migration of a Malyugin ring during phacoemulsification. Postoperatively, the ring was visible in the vitreous cavity and subsequently was retrieved in toto via pars plana vitrectomy using the Malyugin ring injector.
